

# Delta rules

The INFDEV@HR Team

Hogeschool Rotterdam  
Rotterdam, Netherlands

# Introduction

## Lecture topics

- Make it pretty: delta rules
- Booleans, boolean logic operators, if-then-else
- Naturals, arithmetic operators, comparison operators

# Encoding boolean logic

## Introduction

- We can decide that some specific lambda terms have special meanings
- For example, we could decide that a given lambda term means TRUE, another FALSE, etc.
- The important thing is that we choose terms that behave as we wish

## As we wish?

- Suppose we define some lambda terms for TRUE, FALSE, and AND
- We expect these terms to reduce<sup>a</sup> following our expectations of boolean logic
- We can use truth tables to encode our expectations

---

<sup>a</sup>That is, computed according to  $\rightarrow_\beta$

# Encoding boolean logic

Delta rules

The  
INFDEV@HR  
Team

We want to formulate TRUE, FALSE, and AND so that

- $\text{TRUE} \wedge \text{TRUE} \rightarrow_{\beta} \text{TRUE}$
- $\text{TRUE} \wedge \text{FALSE} \rightarrow_{\beta} \text{FALSE}$
- $\text{FALSE} \wedge \text{TRUE} \rightarrow_{\beta} \text{FALSE}$
- $\text{FALSE} \wedge \text{FALSE} \rightarrow_{\beta} \text{FALSE}$

# Defining terms with special meaning

## Choice terms

- Terms with special meaning essentially make a choice when given parameters
- The choice is expressed by either returning, or applying, the parameters

## Delta rules

- We wish to use special symbols to these terms with special meaning
- We define a series of delta rules, which are transformation from pretty symbols into lambda terms (and vice-versa)

## Delta rules

This means that we will be able to write lambda programs such as  $5+3$ , that will then be translated into the appropriate lambda terms

# Booleans

## Idea

- Boolean operators such as TRUE and FALSE must be defined so as to identify themselves
- The choice is expressed by returning their identity from a choice of two options

# Booleans

## Delta rules

The  
INFDEV@HR  
Team

TRUE is defined as a selector of the representative for true, that is the first argument<sup>a</sup>

---

<sup>a</sup>by arbitrary convention

$$(\lambda t \ f \rightarrow t)$$

FALSE is defined as a selector of the representative for false, that is the second argument<sup>a</sup>

---

<sup>a</sup>by arbitrary convention, as long as different from the previous

$$(\lambda t \ f \rightarrow f)$$

```
((TRUE bit1) bit0)
```

```
((TRUE bit1) bit0)
```

```
((TRUE bit1) bit0)
```

```

## AND

- The conjunction<sup>a</sup> of two terms is a function that takes as input two booleans and returns a boolean
- Since we just defined booleans to be two-parameter functions, we know that the two input booleans can be applied to each other
- Given two booleans  $p$  and  $q$ , their conjunction is  $q$  if  $p$  was true, or false otherwise

$(\lambda p \ q \rightarrow ((p \ q) \ p))$

---

<sup>a</sup>AND, or  $\wedge$

## AND

Let us begin to with  $\text{TRUE} \wedge \text{TRUE} \rightarrow_{\beta} \text{TRUE}$

```
(TRUE ^ TRUE)
```

$(\text{TRUE} \wedge \text{TRUE})$

$((\text{TRUE} \wedge \text{TRUE}) \text{ TRUE})$

$((\wedge \text{ TRUE}) \text{ TRUE})$

```
(( ^ TRUE) TRUE)
```

```
(( (λp q→((p q) p)) TRUE) TRUE)
```

$$(((\lambda p \ q \rightarrow ((p \ q) \ p)) \text{ TRUE}) \text{ TRUE})$$

$$(((\lambda p \ q \rightarrow ((p \ q) \ p)) \text{ TRUE}) \text{ TRUE})$$
$$(((\lambda p \ q \rightarrow ((p \ q) \ p)) \text{ TRUE}) \text{ TRUE})$$

```
((λp q → ((p q) p)) TRUE) TRUE)
```

$$(((\lambda p \ q \rightarrow ((p \ q) \ p))) \text{ TRUE}) \text{ TRUE})$$
$$(((\lambda p \ q \rightarrow ((p \ q) \ p))) (\lambda t \ f \rightarrow t)) \text{ TRUE})$$

```
((λp q → ((p q) p)) (λt f → t)) TRUE)
```

```
((λp q → ((p q) p)) (λt f → t)) TRUE)
```

```
( ((λp q → ((p q) p)) (λt f → t)) TRUE)
```

```
( ((λp q→((p q) p)) (λt f→t)) TRUE)
```

$$((\lambda p \ q \rightarrow ((p \ q) \ p)) (\lambda t \ f \rightarrow t)) \text{ TRUE}$$
$$((\lambda q \rightarrow ((\lambda t \ f \rightarrow t) \ q) (\lambda t \ f \rightarrow t))) \text{ TRUE}$$

$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) \ (\lambda t \ f \rightarrow t))) \ \text{TRUE})$$

$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) \ (\lambda t \ f \rightarrow t)))) \text{ TRUE})$$
$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) \ (\lambda t \ f \rightarrow t)))) \text{ TRUE})$$

```
((λq→(((λt f→t) q) (λt f→t))) TRUE)
```

$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) \ (\lambda t \ f \rightarrow t)))) \text{ TRUE } )$$
$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) \ (\lambda t \ f \rightarrow t)))) \ (\lambda t \ f \rightarrow t) )$$

$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) (\lambda t \ f \rightarrow t))) (\lambda t \ f \rightarrow t))$$

$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) (\lambda t \ f \rightarrow t))) (\lambda t \ f \rightarrow t))$$
$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) (\lambda t \ f \rightarrow t))) (\lambda t \ f \rightarrow t))$$

$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) (\lambda t \ f \rightarrow t))) (\lambda t \ f \rightarrow t))$$

$$((\lambda q \rightarrow (((\lambda t \ f \rightarrow t) \ q) (\lambda t \ f \rightarrow t))) (\lambda t \ f \rightarrow t))$$
$$(((\lambda t \ f \rightarrow t) (\lambda t \ f \rightarrow t)) (\lambda t \ f \rightarrow t))$$

$$(((\lambda t \ f \rightarrow t) \ (\lambda t \ f \rightarrow t)) \ (\lambda t \ f \rightarrow t))$$

$$(((\lambda t \ f \rightarrow t) \ (\lambda t \ f \rightarrow t)) \ (\lambda t \ f \rightarrow t))$$
$$((\lambda t \ f \rightarrow t) \ (\lambda t \ f \rightarrow t)) \ (\lambda t \ f \rightarrow t)$$

$$((\lambda t \ f \rightarrow t) (\lambda t \ f \rightarrow t)) (\lambda t \ f \rightarrow t)$$

$$((\lambda f \ t \ f \rightarrow t) \ (\lambda t \ f \rightarrow t))$$

$$((\lambda f \ t \ f \rightarrow t) \ (\lambda t \ f \rightarrow t))$$
$$((\lambda f \ t \ f \rightarrow t) \ (\lambda t \ f \rightarrow t))$$

$$((\lambda f \ t \ f \rightarrow t) \ (\lambda t \ f \rightarrow t))$$

$$((\lambda f \ t \ f \rightarrow t) \ (\lambda t \ f \rightarrow t))$$
$$(\lambda t \ f \rightarrow t)$$

$$(\lambda t \ f \rightarrow t)$$

$$(\lambda t \ f \rightarrow t)$$
$$(\lambda t \ f \rightarrow t)$$

$$(\lambda t \ f \rightarrow t)$$

$(\lambda t \ f \rightarrow t)$

TRUE

It works, but it is probably only because of black magic.

It works, but it is probably only because of black magic.

Or is it? Let's see if we can get lucky again...

## OR

- The disjunction<sup>a</sup> of two terms is a function that takes as input two booleans and returns a boolean
- Like with conjunction, remember that the two input booleans can be applied to one another
- Given two booleans  $p$  and  $q$ , their disjunction is true if  $p$  was true, or  $q$  otherwise

$(\lambda p \ q \rightarrow ((p \ p) \ q))$

<sup>a</sup>OR, or  $\vee$

OR

Let us begin to with  $\text{TRUE} \vee \text{TRUE} \rightarrow_{\beta} \text{TRUE}$

```
(TRUE ∨ TRUE)
```

$(\text{TRUE} \vee \text{TRUE})$

$((\vee \text{ TRUE}) \text{ TRUE})$

```
(( TRUE) TRUE)
```

$((\vee \text{ TRUE}) \text{ TRUE})$

$((\lambda p \ q \rightarrow ((p \ p) \ q)) \text{ TRUE}) \text{ TRUE})$

$$(((\lambda p \ q \rightarrow ((p \ p) \ q)) \text{ TRUE}) \text{ TRUE})$$

$$(((\lambda p \ q \rightarrow ((p \ p) \ q)) \text{ TRUE}) \text{ TRUE})$$
$$(((\lambda p \ q \rightarrow ((p \ p) \ q)) \text{ TRUE}) \text{ TRUE})$$

$$(((\lambda p \ q \rightarrow ((p \ p) \ q)) \text{ TRUE}) \text{ TRUE})$$

$$(((\lambda p \ q \rightarrow ((p \ p) \ q)) \text{ TRUE}) \text{ TRUE})$$
$$(((\lambda p \ q \rightarrow ((p \ p) \ q)) (\lambda t \ f \rightarrow t)) \text{ TRUE})$$

$$(((\lambda p \ q \rightarrow ((p \ p) \ q)) \ (\lambda t \ f \rightarrow t)) \ \text{TRUE})$$

```
((λp q → ((p p) q)) (λt f → t)) TRUE)
```

```
( ((λp q → ((p p) q)) (λt f → t)) TRUE)

$(\lambda t \ f \rightarrow t)$

TRUE

## if-then-else

- The conditional operator `if-then-else` chooses one of two parameters based on the value of the input condition
- Given a boolean `c` and two values `th` and `el`, the result is `th` if `c` was `true`, or `el` otherwise
- Since `c` is a boolean, it already performs this choice!

```
(λp th el → ((p th) el))
```

**if-then-else**

Let us try with `if TRUE  $\vee$  FALSE then A else B  $\rightarrow_\beta$  A`

```
if TRUE then A else B
```

```
if TRUE then A else B
```

```
(( (if-then-else TRUE) A) B)
```

```
(( (if-then-else TRUE) A) B)
```

```

# Natural numbers

## Idea

- Natural numbers such as 3 and 0 must be defined so as to identify themselves
- Their identity is determined by how many times they perform an action
- The only action we have available is applying a function to a term

## Idea

- We will use unary numbers
- A number is defined by how many times it applies a function to a given term
- Zero applications are also possible, in this case we default to the given term

0, 1, etc.

A number is defined as an applicator of a term identifying as successor to another term identifying as zero<sup>a</sup>

---

<sup>a</sup>first and second arguments by arbitrary convention

# Natural numbers

Delta rules

The  
INFDEV@HR  
Team

0 will thus look like

$$(\lambda s \ z \rightarrow z)$$

1 will look like

$$(\lambda s \ z \rightarrow (s \ z))$$

7 will look like

$$(\lambda s \ z \rightarrow (s \ (s \ (s \ (s \ (s \ (s \ (s \ z))))))))))$$

etc.

## Addition

- Adding numbers is a function that takes as input two numbers (say  $m$  and  $n$ ), and returns a number
- The first number applies its first parameter  $m$  times to its second parameter
- The second number applies its first parameter  $n$  times to its second parameter
- We can use the second number as the second parameter to the first, therefore obtaining something that applies  $m+n$  times

$$(\lambda m \ n \rightarrow (\lambda s \ z \rightarrow ((m \ s) ((n \ s) z))))$$

## Addition

Let us try it out to  $2 + 1 \rightarrow_{\beta} 3$

## Multiplication

- Multiplying numbers is a function that takes as input two numbers (say  $m$  and  $n$ ), and returns a number
- The first number applies its first parameter  $m$  times to its second parameter
- The second number applies its first parameter  $n$  times to its second parameter
- We can use the second number as the first parameter to the first, therefore obtaining something that applies  $n + m$  times, starting from  $z$

$$(\lambda m \ n \rightarrow (\lambda s \ z \rightarrow ((m \ (n \ s)) \ z)))$$

## Multiplication

Let us try it out to  $2 \times 2 \rightarrow_{\beta} 4$

## Zero checking

- We might wish to verify whether or not a number is zero
- We can simply pass the number parameters that fail the check (s) and pass it (z)

- $(\lambda m \ n \rightarrow ((m \ (\lambda x \rightarrow \text{FALSE})) \ \text{TRUE}))$

## Zero checking

Let us try it out to  $0 = 2 \rightarrow_{\beta} \text{FALSE}$

## Other arithmetic operators

- Division, subtraction, and all manners of comparison operators can be defined similarly
- The level of detail of the specification can be compared to that of a very high level CPU
- This means that we are, to an extent, programming in a sort of assembly
- This is the reason why the traces have been so verbose so far

## Other arithmetic operators

- We could also define numbers in base two instead of base one
- This would save processing time, but would result in a slighter more complex specification
- We will just ignore these engineering details: we only focus on **what** can be done, not the best way to do it

# Conclusion

## Recap

- Lambda terms can be used to encode arbitrary basic data types
- The terms are always lambda expression which, when they get parameters passed in, identify themselves somehow
- Identification can be done by applying something (possibly even a given number of times), or returning one of the parameters

## Recap

- There are many encodings of data types, but they all behave in the same way by producing the same outputs for the same inputs
- From now on we will start ignoring the reduction steps for simple terms such as  $3+3$
- We will instead focus on more complex data structures, such as tuples, discriminated unions, and even lists
